The fact that R runs on in-memory data is the biggest issue that you face when trying to use Big Data in R. The data has to fit into the RAM on your machine, and it's not even 1:1. Because you're actually doing something with the data, a good rule of thumb is that your machine needs 2-3x the RAM of the size of your data.

In the MOAC Module 5 assignment, the approach taken was to sanitize the data by hand, allowing it to be loaded into R with a simple call to the read.table command. Its a good idea to look at

the raw files to understand what you are dealing with, but surely there is a more elegant way...

The dataset is called MplsStops and holds information about stops made by the Minneapolis Police Department in 2017. Of course, you can access this dataset by installing and loading the car package and typing MplsStops. However, I want to simulate a more typical workflow here.

1.3 Loading the Data set. There are some data sets that are already pre-installed in R. Here, we shall be using The Titanic data set that comes built-in R in the Titanic Package. While using any external data source, we can use the read command to load the files(Excel, CSV, HTML and text files etc.) This data set is also available at Kaggle. You may download the data set, both train and test files.

This book introduces concepts and skills that can help you tackle real-world data analysis challenges.
