The successful development and operation of an EIS must address a myriad of potential organizational and technical challenges and creates responsibilities for management and developers. Management must define objectives for the system, allocate necessary resources, put the development staff in place, fight political resistance, and be visible users of the system. Developers must determine information requirements for the system, select appropriate hardware and software resources, gain access to necessary data, design screens, and oversee the evolution of the system. Executive Information Systems provides valuable information and materials on these and other key EIS issues. This important work was gathered from information that was previously scattered in academic journals, trade publications, conference proceedings, and university working paper series. This book contains important concepts, understanding, insights, and real-life experiences about how to successfully develop an EIS. Written for anyone who wants to learn about EIS, this book is divided into four parts: The Emergence of EIS, The Nature of Executive Work, Developing an EIS, and The Impact of EIS. Interspersed throughout the book are detailed descriptions of EIS in a variety of organizations. For quick, easy access, these descriptions are marked in the Table of Contents as "EIS in Action" and are intended to make EIS more real and less abstract. Executive Information Systems provides a wealth of practical, hard-won information and advice that has never been published together in one comprehensive volume.

In the current debate on military capabilities and defence industry, the term "dual-use" means those technologies that can be used to develop systems and equipment for both civilian and military purposes. Changes occurred in modes of technological innovation have brought about a growing interconnection between the civilian, security and defence sectors, especially from an industrial point of view. In this context, "dual-use helicopters" refer to platforms that have been designed in compliance with certain standards and are structurally built so that they can satisfy civilian, military or security users with only minimal adjustments or additions. This volume analyses the use of helicopters by armed forces, law enforcement agencies and emergency services, in three countries: Italy, France and the United Kingdom. Such landscape is diversified and fragmented, with different approaches and above all helicopter fleets made up of diverse platforms of subsequent generations - some with more than 30 years of life cycle behind them. In all three countries, national defence budget's restrictions have demanded more efficient solutions for the necessary fleet renewal and management in the medium term - a renewal often coupled with a quantitative reduction. In this respect, the option of a dual-use helicopter becomes interesting in that it ensures greater security, effectiveness and efficiency in use by armed forces. This calls for a common and in-depth reflection on the problem by all actors in the defence and security field.
