COMPREHENSIVE COVERAGE OF NONLINEAR PROGRAMMING THEORY AND ALGORITHMS, THOROUGHLY REVISED AND EXPANDED Nonlinear Programming: Theory and Algorithms --now in an extensively up-

dated Third Edition--addresses the problem of optimizing an objective function in the presence of equality and inequality constraints.

In mathematics, nonlinear programming (NLP) is the process of solving an optimization problem where some of the constraints or the objective function are nonlinear. An optimization problem is one of calculation of the extrema (maxima, minima or stationary points) of an objective function over a set of unknown real variables and conditional to the satisfaction of a system of equalities and ...

Nonlinear Programming (3rd ed.) by Mokhtar S. Bazaraa (ebook)

Most nonlinear programming algorithms are targeted to a particular subclass of problems. For example, some algorithms are specifically targeted to large, smooth unconstrained problems in which the matrix of second derivatives of $f(x)$ contains few nonzero entries and is expensive to evaluate, while other algorithms are aimed specifically at convex quadratic programming problems, and so on.
