Swiss National Bank (SNB) - Banknotes and coins

Antonio Riccio, vice-president, sales and marketing at Landqart, discusses the future outlook and most recent changes in banknote production and how hybrid substrates and polymer have improved security, durability, cost efficiency and public recognition. The polymer used in our banknotes is polypropylene, which is formed into a durable yet lightweight plastic film. It is coated with layers of special ink, which carry the printed design of a banknote. The polymer material allows us to include 'windows' or clear sections in the design, which makes them harder to counterfeit.

Polymer Banknotes Q A Library

Polymer Project

Banknotes are often found in high-profile crimes such as armed robberies, bribery, and terrorist activity. However, such exhibits present a challenge to forensic operatives regarding fingermarks development, due to their mass quantities, potential for fingermarks on both sides, and their unique complex background in terms of color, irregular patterns, and topography.

Polymer banknotes entered mainstream circulation in 1992. Some Polymer notes have performed well in the investment market. The value of a banknote is determined by scarcity, condition and demand. As with all investing it is important to buy quality. There is a range of catalogues that estimate the value of specific banknotes.
