The relay must come into action whenever there is a fault and must not operate if there is no fault. Some relays are used for the protection of the power system. Some of them are primary relay meaning that they are the first line of defence. Such relays sense the fault and send a signal to the proper circuit breaker to trip and clear the fault.

"Power System Relaying, 3rd Edition" continues its role as an outstanding textbook on power system protection for senior and graduate students in the field of electric power engineering and a reference book for practising relay engineers. This book provides the student with an understanding of power system protection principles and an insight into the phenomena involved.

Used by universities and industry courses throughout the world, Power System Relaying is an essential text for graduate students in electric power engineering and a reference for practising relay and protection engineers who want to be kept up to date with the latest advances in the industry.

The protective relaying is used in electrical substations to give an

alarm or to cause prompt removal of any element of the power system from service when that element behaves abnormally. The abnormal behavior of an element might cause damage or interference within the effective operation of the rest of the system.

Function of Protective Relays in Power System

The system framework introduces a dynamic, interactive transient of the relay models for the power system. Interactive protection operation analysis in complex power systems In the paper, the interaction of numerical protective relays with a complex power system operation during transients and faults is studied.

The basic information with regard to the power system is collected by equipment in the various substations and power plants. The distributed control system equipment enables remote data acquisition. Data may also be entered manually or calculated. These data are treated exactly like the automatically collected data.

From Automatic Source Transfer Schemes to Utility Intertie Schemes, relay logic is the heart of any modern protection. The hallmark of a good design is simplicity. Knowing how to design relay logic to be simple, effective, reliable and serviceable is the specialty of PSA. PSA also offers customized templates to help customers change settings quickly, easily and with reduced complexity.

The function of protective relaying is to cause the prompt removal from service of any element of a power system when it suffers a short circuit, or when it starts to operate in any abnormal manner that might cause damage or otherwise interfere with the effective operation of the rest of the system. The relaying equipment is aided in this task by circuit breakers that are capable of disconnecting the faulty element when they are called upon to do so by the relaying equipment.
