Gravimetric analysis describes a set of methods used in analytical chemistry for the quantitative determination of an analyte based on its mass. The principle of this type of analysis is that once an ion's mass has been determined as a unique compound, that known measurement can then be used to determine the same analyte's mass in a mixture, as long as the relative quantities of the other constituents are known. The four main types of this

method of analysis are precipitation, volatilization, el Thermogravimetric analysis (TGA) measures weight changes in a material as a function of temperature (or time) under a controlled atmosphere. Its principle uses include measurement of a material's thermal stability, filler content in polymers, moisture and solvent content, and the percent composition of components in a compound.

The underlying principles and theories of gravimetric analysis are as stated below : (i) Law of mass action and reversible reactions, (ii) Principle of solubility product, and (iii) Common ion effect.

A method in which thermogravimetry and differential thermal analysis are combined and measured simultaneously by a single apparatus. This is definition of TG-DTA by JIS (Japanese Industrial Standard) As defined above, TG is a technique that measures mass change in a sample, and it is used to detect evaporation, decomposition, oxidation and other effects of temperature change that cause mass changes.

General Principles In gravimetric analysis measures the mass of a material formed in the reaction of the analyte with the reagent. A chemical reaction for gravimetric analysis is where a moles of analyte A contained in the sample reacts with r moles of the reagent R to form the precipitate $AaRr$, noted as solid phase (s) in the reaction.

From Wikipedia, the free encyclopedia Thermogravimetric analysis or thermal gravimetric analysis (TGA) is a method of thermal analysis in which the mass of a sample is measured over time as the temperature changes.

Precipitation gravimetry is an analytical technique that uses a pre-

cipitation reaction to separate ions from a solution. The chemical that is added to cause the precipitation is called the precipitant or precipitating agent.

The principle of Gravimetric Analysis: The principle behind the gravimetric analysis is that the mass of an ion in a pure compound and can be determined. Later, used to find the mass percent of the same ion in a known quantity of an impure compound. Gravimetric Analysis Apparatus. Steps followed in the Gravimetric Analysis

Basic principles of volumetric analysis The solution to be analysed contains an unknown amount of chemicals. The reagent of unknown concentration reacts with a chemical of an unknown amount in the presence of an indicator (mostly phenolphthalein) to show the end-point. It's the point indicating the completion of the reaction.
