The peak-to-peak value is used, for example, when choosing rectifiers for power supplies, or when estimating the maximum voltage that insulation must withstand. Some common voltmeters are calibrated for RMS amplitude, but respond to the average value of a rectified waveform. Many digital voltmeters and all moving coil meters are in this category.

The tall marker indicates where the peak is expected to be and the two shorter markers show you the Retention Time Window. By default, if the apex of the peak is within the Retention Time Window, the peak should be identified properly. However, we see that the apex of the peak is just outside of the Retention Time Window (Figure 6).
